Democracy reinvented by Blockchain

Democracy is such a great invention ! It allows anyone to give his stupid opinion like your drunk racist uncle during family meetings who can freely claim "we are no longer home".

At Democracy, we deeply believe that we should preserve this amazing way to deliberate in order to build a more peaceful and inclusive society, for the best… and also the worst.

However, during the last years, democracy has been weakened. The reasons? Well they are numerous but the two major ones we identified were :

- Pool results contests with among others the remote voting in the United States during the last elections.
- The citizen's requirements to give more often their opinion about the great stakes of our societies.

Having these facts in mind, we have built a solution able to answer this. Since the first time, we thought that an online solution would allow citizens to give their opinions as often as they want. Nevertheless, every IT system is vulnerable to some attacks, can be corrupted and thus can be accused from giving wrong results.

Hence, we had to find a non-decaying and invulnerable system. That is where a blockchain based system came to our minds in an unavoidable way.

The blockchain allows decentralized transactions which is checked all along the chain by several stakeholders. A trustworthy exchange method that nobody can blame for unaccurate results.

We are proud to announce to the public that we just released our beta version. Our long run goal is to make governments use our trustworthy solution, in order to allow them to involve more and more citizens in the decisions which matter.

Do not hesitate to give use your feedback at contact@democracy.com ! If you work in IT and are seeking for a meaningful job, and participate to make democracy better, we are also hiring ! Do not wait to send us your resume at hiring@dmocracy.com.

Try our solution, make democracy great again !
